Demag CC6800 Tipped over Tragic Accident in Vungtau, Vietnam

Below a series of pictures of a Demag CC6800 which tipped over, while lifting a 350 Tons module. According to the information received, the crane was not supported by crane mats and the soil bearing pressure was apparently exceeded with this tragic incident which cost 5 workers their lives.

It is a shame that these accidents still happen and no proper precautions are taken to avoid the tipping over of such a large crane. Proper load spreading should have been done, either with steel support mats or hard wood support mats in order to reduce the high local crawler track loading on the subsoil.

Causing a large project delay and a lot of equipment damage, the worse part **of this incident is that 5 persons lost their lives.**
